

Professional DVD Duplication By Easy Disc

What is DVD replication?

DVD replication differs from every other disc copying mechanism you've read about...until now. Much more complex and advanced than CDs, DVDs are a finer source of media storage providing durable, dependable solutions, extensive data capacities, and an improved source of information dissemination.

The DVD replication process begins by creating DVDs from scratch. A disc's master content, such as audio tracks or videos, is transferred onto a super-smooth glass master by "etching", or burning, the data on it with a laser. This creates a metal stamper used in disc replication.

Easy Disc technicians utilize high-end replication equipment to press content into molten polycarbonate plastic, producing plastic rings featuring DVD coding. The discs are subsequently topped with a thin layer of aluminum, and a lacquer coating.

Easy Disc employees carry out this complex process with 100% accuracy, project after project, disc after disc, day after day.

Easy Disc's **affordable DVD replication** services are quality, wallet-friendly, and the best in the industry. We strive to exceed expectations and provide the results customers require--in other words, disc replication at its best!

Take advantage of our affordable, quality services, and enjoy the hassle-free disc manufacturing experience you want. Our team of experts always find a solution that's affordable and specific to client needs. Give us a call today!
